Legal Notice

This document summarizes EMVCo's present plans for type approval testing services and policies and is subject to change by EMVCo at any time without notice to any party. Neither this document nor any other document or communication creates any binding obligations upon EMVCo or any test laboratory, vendor or other third party regarding testing services or EMVCo approval, which obligations will exist, if at all, pursuant to separate written agreements executed by EMVCo and such test laboratories, vendors or other third parties. In the absence of a written binding agreement pursuant to which EMVCo has agreed to perform testing services for a vendor or to permit a third party to act as a test laboratory, no vendor, test laboratory or any other third party should detrimentally rely on this document, and EMVCo shall not be liable for any such reliance.

No vendor, test laboratory or other third party may refer to a product, service or facility as EMVCo approved, in form or in substance, nor otherwise state or imply that EMVCo (or any agent of EMVCo) has in whole or part approved a vendor, test laboratory or other third party or its products, services, or facilities, except to the extent and subject to the terms, conditions and restrictions expressly set forth in a written agreement with EMVCo, or in an approval letter issued by EMVCo. All other references to EMVCo approval are strictly and actively prohibited by EMVCo.

Under no circumstances should EMVCo type approval, when granted, be construed to imply any endorsement or warranty regarding the functionality, quality, or performance of any particular product or service, and no party shall state or imply anything to the contrary. EMVCo specifically disclaims any and all representations and warranties with respect to products that have received approval and to the type approval process generally, including, without limitation, any implied warranties of **merchantability, fitness for purpose or noninfringement**. All rights and remedies relating to products and services that have received EMVCo type approval are provided solely by the parties selling or otherwise providing such products or services, and not by EMVCo, and EMVCo accepts no liability whatsoever in connection with such products and services.

Any and all uses of this document is subject to the terms and conditions of the EMVCo Terms of Use agreement available at www.emvco.com. This document is provided "AS IS" without warranties of any kind, and EMVCo neither assumes nor accepts any liability for any errors or omissions contained in this document. EMVCO DISCLAIMS ALL REPRESENTATIONS AND WARRANTIES, EXPRESS OR IMPLIED, INCLUDING WITHOUT LIMITATION IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, TITLE AND NON-INFRINGEMENT, AS TO THIS DOCUMENT.

EMVCo makes no representations or warranties with respect to intellectual property rights of any third parties in or in relation to this document. EMVCo undertakes no responsibility to determine whether any implementation of this document may violate, infringe, or otherwise exercise the patent, copyright, trademark, trade secret, know-how, or other intellectual property rights of third parties, and thus any person who implements any part of this document should consult an intellectual property attorney before any such implementation.

Without limiting the foregoing, this document may provide for the use of public key encryption and other technology, which may be the subject matter of patents in several countries. Any party seeking to implement this document is solely responsible for determining whether its activities require a license to any such technology, including for patents on public key encryption technology. EMVCo shall not be liable under any theory for any party's infringement of any intellectual property rights in connection with this document.

1 Scope

EMVCo, LLC (“EMVCo”) is the owner of the EMV Integrated Circuit Card Specification for Payment Systems (version 4.3), hereinafter called EMV Specification.

EMVCo’s objective in establishing the type approval process described in this document is to create a limited mechanism for testing IFMs used in integrated circuit chip card terminals for sufficient conformance with the EMV Specification for their stated purpose as of the date of such testing, subject to all of the limitations and restrictions of the type approval process set forth herein.

All readers of this document are advised that type approval, when granted by EMVCo, shall not be construed as a warranty or representation of any sort, nor may it be relied upon by any party as an assurance of quality or functionality of any product or service. Please note the legal notice stated above at page 2 of this document for important limitations on the scope of type approval.

This document describes the EMVCo’s specific Loopback Application to be implemented in an IFM in order for this IFM to undergo the Type Approval Tests, and interoperate with the EMVCo test tool accordingly.

The target audience of this document includes:

- IFM providers
- Testing laboratories accredited to perform the type approval tests
- Auditors acting on behalf of EMVCo

2 Loop-back Concept

The ISO 9646 abstract model chosen is the remote test method where the existing protocol between the IUT and the LT (the protocol to be tested) also conveys the TM-PDU (Test Management PDU):

The implementation of the remote test method in the context of the Terminal Level 1 Type Approval is called the « loop-back » concept, where the response APDU that the UT gets is derived into the next command APDU:

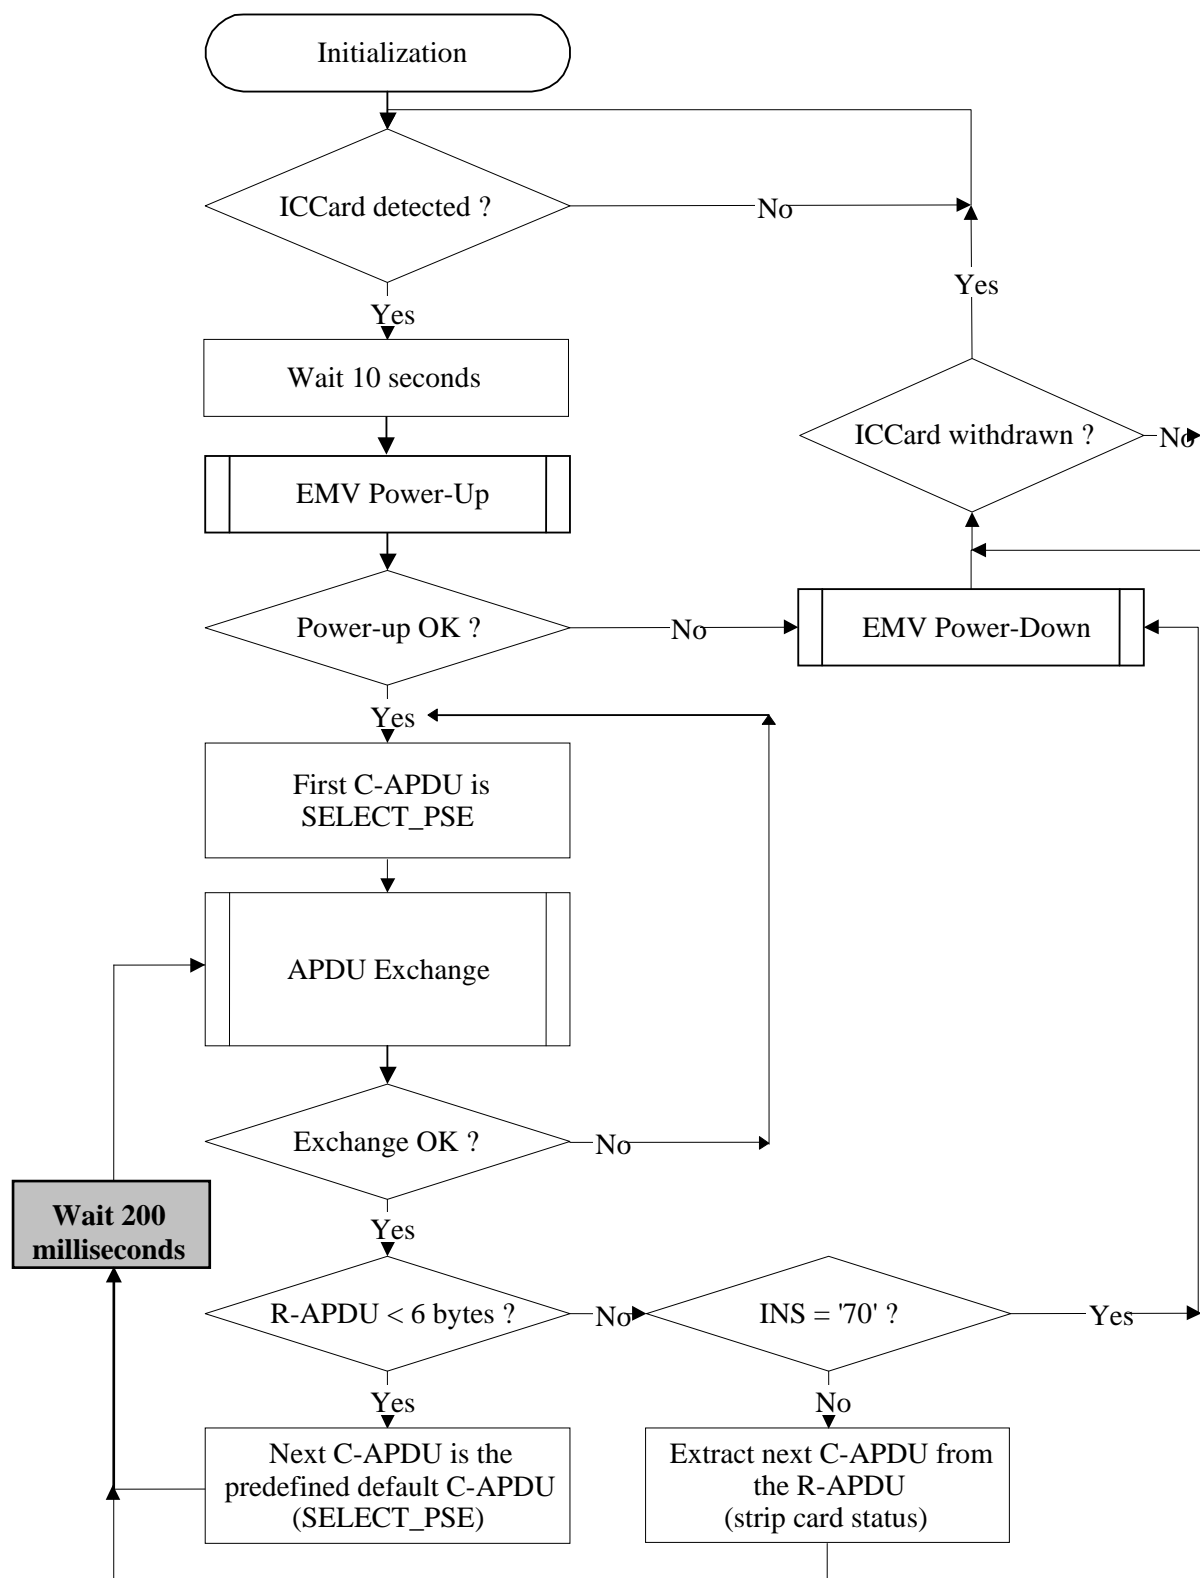

3 System Under Test Behaviour

The System Under Test (SUT) represents the Terminal that contains the IFM to be tested.

The SUT behaviour can be summarized by the following points and flowchart :

1. The SUT waits for a card to be inserted.
2. When a card is inserted, the SUT shall wait 10 seconds before it activates the card.
3. If the activation sequence went wrong, the SUT shall deactivate it and waits for its removal and then return to the state described in the first bullet.
4. If the activation sequence went fine (ICC conforms to EMV), the first C-APDU to be sent is a SELECT Payment System Environment APDU ('00A404000E'+«1PAY.SYS.DDF01»+'00').
5. The current C-APDU is sent and the R-APDU is awaited.
6. If the command failed (according to the protocol) but no early deactivation occurred, then the IUT shall transmit the relevant status to the TAL (loopback) which immediately sends the next C-APDU: the SELECT Payment System Environment APDU.
7. Else (If it succeeded) :
 - If the R-APDU is less than 6 bytes long (it cannot be derived into the next C-APDU), the next C-APDU is the SELECT Payment System Environment APDU.
 - Else :
 - If the second byte of the R-APDU equals '70', the SUT shall deactivate the ICC and waits for its removal and then return to the state described in the first bullet.
 - Else the R-APDU is derived into the next C-APDU by stripping the status word.
 - Loop to the fifth step (exchange of APDU).
8. The SUT shall wait 200 milliseconds.
9. Then, the SUT shall loop to the fifth step (APDU Exchange).

4 Lower Tester Test Application

The test application in the LT is very simple. It basically stores a set of predefined answers (a specific set of commands is used for each executable test). After it has been activated, each time it gets a command from the SUT, it sends the current response in the set, starting from the first one, and skipping to the next each time one is sent.

Everything else is governed by the protocol rules and the test modes for the current test.
